

J1939 MSG Database

The CLTM12-S CAN database (.DBC) file contains the complete definitions for the proprietary J1939 messages used by the CLTM12-S. These messages include:

- The output state message (TX)
- The input state message (TX)
- The command message (RX)

By associating this DBC file with a CANalyzer interface that is actively communicating with a CLTM12-S, it will be possible to decode the messages being transmitted by the CLTM12-S, and to toggle the outputs ON and OFF by simulating the command message.

Download DBC file here:
