J1939 MSG Database

The CM-Series Controller CAN database (.DBC) file contains the complete definitions for the proprietary J1939 messages used by the CM-Series Master Module Controller. These messages include:

- The output state message (TX)
- The input state request message (RX)
- The switch status message (TX)
- The command message (RX)

By associating this DBC file with a CANalyzer interface that is actively communicating with a CM-Series Controller, it will be possible to decode the messages being transmitted by it, and to send info to CM-Series switches by simulating these messages.
